Acknowledgement

In the name of Allah (swt) the most merciful and most graceful, have successfully completed my research work. I would like to express my thanks to my research supervisor Dr. Repon kumer saha, Dean, Assistant Professor, Dept. of Pharmacy, EWU, who had been always optimistic and full of enthusiasm and ideas. His intellectual capability and vast knowledge in the research work help me to do such an intellectual and interesting research work. His friendly behavior always help me to do my research work with encourage.

I am grateful Dr. Repon kumer saha, Assistant Professor, Dept. of Pharmacy, EWU, for his guidance, criticism and encouragement during the preparation of this study.

I am gratefully acknowledged to chairperson professor Dr. Sufia Islam Associate professor & Chairperson, Department of Pharmacy, EWU for her inspiration in my study Moreover, I am grateful to my administration as they provide the facilities to use the laboratory for research work.

Finally, I would like to express my sincere gratitude to my paren, brother, Sisters and friends for their kind co-operation and support to complete my study including my research project.

ABSTRACT

Sensit tablet is a combination product of flupentixol and melitracen in which Flupentixol is neuroleptic and melitracen is anti-depressant drug. This formulation is widely used in Bangladesh in severe depression and neuralgia which have high prevalence in Bangladesh perspective. The purpose of this work is to find whether the drugs photosensitive or not. The stability of drugs in the formulation was determined by scrutinizing the potency level by spectrophotometric method and physical parameters of the tablet. Specific amounts of tablet were exposed to different environment including sunlight, florescent light and normal room condition at definite temperature. The sample then was collected at definite time interval and physical parameter and potency was later determined. All the cases, the physical parameters were within range but for potency degraded as downhill. Throughout the process this was ensured adequate drug solubility and maximum assay sensitivity. The linearity ranges for the two drugs were measured accurately with precision. From the study of the project it is concluded that the drugs require light protection to remain stable within the shelf life.

Keywords: Neuroleptic, Anti-depressant, photosensitive, spectrophotometric method, shelf life.

Chapter1:

Introduction

1.1 Flupentixole

Flupentixole is a typical antipsychotic or neuroleptic drug. Flupentixole has the structure illustrated below and the name 2-(4-{3-[2-(trifluoromethyl)-9,9a-dihydro-4a-thioxanthen-9-ylidene]propyl}piperazin-1-yl)ethan-1-ol. The compound lies in the class of thioxanthen group. It is soluble in water and alcohol but insoluble in dichloromethane (DCM).

(Acharjya, S. K. et al, 2010)

The compound was first divulged in the GB patent 925538 to Smith Kline & French Laboratories in 1963 and reported to have e.g. tranquilising and central nervous system depressant activity. It is used to treat schizophrenia thus having antagonistic effect on wide variety of receptor especially dopamine, serotonin receptor. Its antipsychotic effect is due to D_2 and/ or $5-HT_{2A}$ antagonism whereas its antidepressant effect is owing to preferential D_2/D_3 autoreceptor blockade, resulting in increased postsynaptic activation.

(Flupentixol, 2012)

Flupentixole absorption occurs slowly or incomplete after oral absorption. It is highly bound to plasma protein (>95%). Its metabolism occurred in liver and has a half life about 19 to 39 hours. (Yunus, M, 2011)

1.2 Melitracen

Melitracen is a tricyclic class of anti-depressant drug. The structure is illustrated below and has a systemic name 3-(10,10-dimethylantracen-9(10*H*)-ylidene)-*N,N*-dimethylpropan-1-amine. Kefalas revealed the drug in the GB patent 939856 in 1963. The mechanism of melitracen is sorted out and it is said to have suppression on the receptor of nor-adrenaline and serotonin. It also shows attraction to muscarinic and histaminic (H_1) receptor in varying

extents. Onset of action of melitracen takes place instantly. The drug is used in the treatment of Trigeminal Neuralgia and severe depression. (Sheikh, I.A, 2009)

Due to show some side effects, it is co- administered with flupentixole to reduce the side effect in lower doses in combinationally. (Tripathi K.D, 2003)

The combination has niggling serious side effects due to low drug dosage (10 mg, Melitracen and 0.5 mg Flupentixol per tablet). The aim of this work is to scrutinize the effect of light on SENSIT tablet (Flupentixole-Melitracen combination products).

Chapter 2:

LITERATURE REVIEW

2.1 Studies on Flupentixole and Melitracen combination product:

Meng. Q et al (2007) determined the a method using LC/ESI-MS/MS, for simultaneous quantitation of flupentixol and melitracen—antidepressant drugs, in human plasma

Under this method they stated ‘the determination of the target compounds was quantified in a positive ion mode and multiple reactions monitoring (MRM). The method involved a repeated liquid–liquid extraction with diethyl ether and analytes were chromatographed on a C-8 chromatographic column by elution with acetonitrile–water–formic acid (36:64:1, v/v/v) and analyzed by tandem mass spectrometry. The method was validated. The correlation coefficients of both analyt were >0.998 for six sets of calibration curves. The recovery was 60.9–75.1% for flupentixol, melitracen and internal standard. The minimum limit of quantitation detection was 26.1 pg/ml and 0.206 ng/ml for flupentixol and melitracen respectively . Intra- and inter-day precision of the assay at three concentrations were 2.15–5.92% with accuracy of 97.6–103.0% for flupentixol and 0.5–6.36% with accuracy of 98.7–101.7% for melitracen. The method was suitable for bioequivalence study of flupentixol and melitracen in healthy human male volunteers’. (Meng Q. et al, 2007: p 785-792)

Li-hong, C., Jin-hong, L. (2010) investigated the therapeutic effect of Flupentixol and Melitracen on patients of dyspepsia with anxiety and depression. Their approach was One hundred twenty eight dyspepsia patients with different degree of anxiety and depression were randomly divided into two groups: group 1 is treatment group, and group 2 is comparison group. For group 2, on the basis of mental leading, patients were dealt with the routine treatment on the principle of individuality, while for group one, patients were treated by Flupentixol and Melitracen (Deanxit) every morning and midday, 1 pill per time. Comparing with group 2, both the apparent efficiency and the total efficiency of group 1 were prior to the

other (P0.05). The study shows Flupentixol combined with Deanxit is therapeutically effective in treating FD patients with anxiety and depression. (Li-hong C, Jin-hong L, 2010)

Chhalotiya, U K et al (2011) determined a chromatographic method have been developed for the simultaneous estimation of Flupentixol dihydrochloride and Melitracen hydrochloride in combined tablet dosage form. The first method is based on the use of simultaneous equation, the second method is based on the simultaneous equation using AUC of the two drugs, the third method is based on the use of absorbance ratio method and the fourth one is based on first order derivative method. Both the drugs obey the Beer's law in the concentration ranges employed for these methods. The methods were validated by following the analytical performance parameters suggested by the International Conference on Harmonization (ICH). All validation parameters were within the acceptable range. The developed methods were successfully applied to estimate the amount of Flupentixol dihydrochloride and Melitracen hydrochloride in combined tablet dosage forms. (Chhalotiya, U K et al, 2011)

Yunus, M. et al (2011) established a method to quantify the Flupentixol Dihydrochloride in bulk and pharmaceutical formulations. In their experiment linearity range for flupentixol dihydrochloride at its wavelength of detection at 230 nm was found. The linear regression equation obtained by least square regression method, were $Y = 0.0639X + 0.0013$, where Y is the absorbance and X is the concentration (in $\mu\text{g/ml}$) of pure drug solution. The limit of detection and limit of quantification was found to be $0.324\mu\text{g/ml}$ & $0.982\mu\text{g/ml}$. The validity of the described procedure was assessed. The result was effective with good precision. The procedure was successfully applied to the determination of flupentixol dihydrochloride in pharmaceutical formulations without any interference from common excipients.

(Yunus. M et al, 2011: vol 2)

CHAPTER 3:

MATERIALS & METHODS

3.1 Experimental:

Spectral and absorbance measurements were accomplished on UV visible Spectrophotometer. Electronic balance was used for measuring the weight of samples. Commercially available tablets of flupentixol and Melitracen combined drugs as brand name “SENSIT” manufactured by “ESKAYEF BANGLADESH LTD” were purchased from the local market and estimated.

3.1.2 CHEMICALS AND REAGENTS

| Reagents Name | Source (Supplier Name) |
|----------------------------------|-------------------------------------|
| Concentrated Sulfuric acid | Germany (Merk) |
| Distilled Water | SMIC/China |
| Flupentixol & Melitracen Tablets | SENSIT(Eskayef Bangladesh Ltd) |
| Standard Tablet | Melixol(Square pharmaceuticals Ltd) |

3.1.3 APPARATUS/INSTRUMENTS

| Name | Model/Code | Manufacturer/Supplier |
|---------------------------|-------------------|-----------------------|
| UV- Vis spectrophotometer | UV-1800 | Shimadzu, Japan |
| Friabilator | VEGGO | India |
| Electronic balance | Precisa -FD120A | Switzerland |
| Vernier caliper | 0-150 mm | Shanghai,China |
| Tablet Hardness tester | Manually operated | India |

3.2. Optimization:

3.2.1 Scanning and determination of maximum wavelength (λ_{max}) for drugs:

In order to find out the wavelength of maximum absorption of the drug, qualitative solution of the drug was dissolved in sulfuric acid and scanned using UV spectrophotometer within the wavelength region of 200- 400 nm against 0.1 N H₂SO₄ as blank. The absorption curve in UV-Vis spectrometer gave the absorption maxima at 229 nm for Flupentixol and at 258 nm for melitracen separately run during the analysis. The literature review suggests that the absorption maxima are for flupentixol at 229 nm and for Melitracen at 258 nm.

3.3 Sample collection:

Determination of photolytic degradation of my interested tablets was done by exposing the specific amount of tablets in a variety of specific exposure condition and then collected for carrying out experiments to determine the physical parameters followed by potency measurements. Three types of photo exposure condition were chosen for this purpose which included the following: Sunlight exposure (winter and summer), Exposure to normal room temperature (2 weeks, 1 month, 2 month) and Bulb light exposure (25 watt, 40 watt bulb).

Each of the cases, thirty tablets were exposed to that environments and isolating them by using plastic transparent paper and box to prevent the interference of outside particulates. While undergoing the experiment which lasts for nine hours, after every three hours ten tablets were collected and labeled as "3 Hours". These processes were done with every three hours until nine hours. The sample were collected and labeled as "6 Hours" and "9 Hours" respectively. Temperature was measured in sunlight exposure by thermometer. In winter the temperature noted was in the range from 98° F to 105° F and in summer the temperatures noted were in the range from 99° F to 108° F and more. But for nine hours sample, exposed temperatures were less than 108° F.

3.4 Determination of physical parameter:

Several physical parameters were checked before in engaging in potency estimation. Hardness tests, friability test, weight variation test, thickness test of the tablets were the notable parameters. All these physical tests were done to see whether any close relationship with photo- degradation or not.

3.4.1 Tablet Hardness:

Hardness tester was used in this purpose of the eruption of the tablets to determine the tensile strength of the tablet and reading was measured in kilogram (kg).

3.4.2 Friability test:

The test is accomplished to evaluate the effect of friction or shocks which results in breaking, capping or chapping of the tablet. The friabilator was used for this purpose. Preweighed sample of tablets (10) was placed in the friabilator, which was then operated for 100 revolutions. Tablets were dusted and reweighed. The tablets should not lose more than 1% of their weigh.

3.4.3 Weight variation test:

Ten tablets were weighed individually and the average was taken and comparing the individual tablet weight to the average one and observed whether the individual tablet were within range or not according to USP.

3.4.4 Tablet thickness: Thickness test was done by using by precise measuring instrument called vernier calliper. The measurement was expressed in length unit in (cm or mm).

Calculation:

Thickness = sliding scale (mm) + vernier scale (mm) × vernier constant

3.5 Preparation of sample solution:

Three Sensit tablets of flupentixol-Melitracen combo drugs were accurately weighed and finely powdered and mixed. The average weight of powder was transferred into 100 ml

volumetric flask. Powder was dissolved into the 100 ml of 0.1N H₂SO₄. The prepared solution was later filtered through a filter paper. 10 ml of filtered solution was diluted to 100 ml by adding 0.1N H₂SO₄ in 100 ml volumetric flask. Then the absorbance of these solutions was measured at 229nm and 258nm for flupentixol and melitracen respectively by the UV-Vis spectrophotometer.

3.6 Preparation of Standard solution & Calibration curve for Melitracen and Flupentixol:

Before the preparation of standard calibration curve for Melitracen and Flupentixol, it was worthwhile to prepare the standard solution. The weight of 5 standard tablets was accurately weighed and finely powdered and mixed. The average weight of powder for 5 tablets was transferred to 100 ml volumetric flask, where it was allowed to dissolve in 100 ml 0.1N H₂SO₄. A succession of dilution (5 times) was carried out with the standard stock solution, thus getting a known amounts of flupentixol (10, 2, 0.4, 0.08, 0.016 µg/mL) and melitracen (200, 40, 8, 1.6, 0.32 µg/mL).the absorbance of MEL and FLU were estimated by respective λ_{max} through scanning by UV-Vis spectrophotometer and by fitting these values against concentration in the graph led to the straight-line equation of calibration curve.

CHAPTER 4:

RESULTS & DISCUSSION

4.1 Result & Discussion:

After collections of sample physical parameters were checked in which the weight variation of the entire sample were within the range for ten tablets according to USP which is ± 10 for 130 mg or less dosage form. There was no major divergence in content uniformity in exaggerated condition.

Tables and figures of weight variation for control or normal room, sunlight exposed and under florescent light condition are illustrated below:

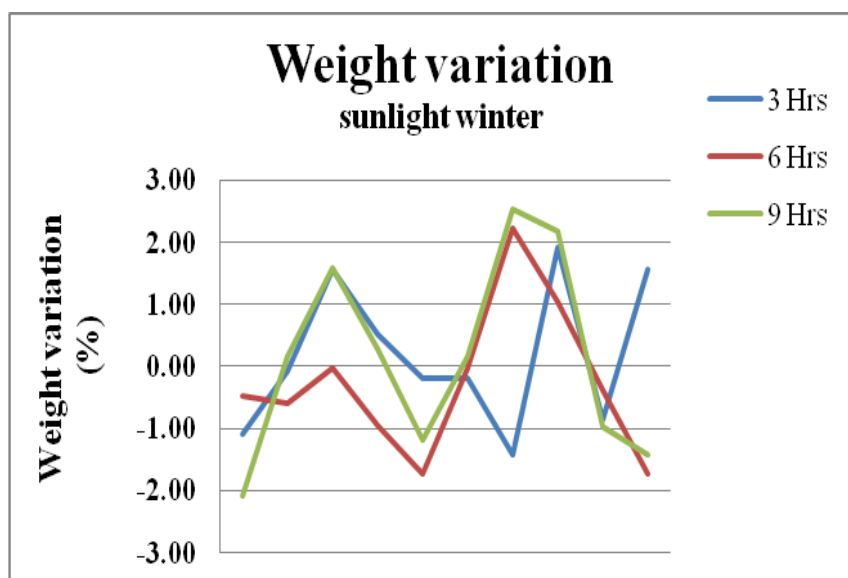

Fig 4.5: Percentage weight variation of Sunlight winter sample.

There is hardly any effect on the friability of the tablets on exposure of the light and radiation. the parameters falls within the range for all the sample, for friability it was not more than 1%. Friability of tablets for control, under florescent light and sunlight exposure is given in table:

Table 4.16: Data for the friability test of all sample.

| | Sample | Initial weight (gm) | Weight after Rotation (gm) | Friability (%) |
|-------------------|----------------------|---------------------|----------------------------|----------------|
| Control | 1 st days | 0.8638 | 0.8618 | 0.23 |
| | 2 nd week | 0.8706 | 0.8696 | 0.115 |
| | 1 month | 0.8609 | 0.8604 | 0.05 |
| Bulb(25watt) | 3hrs | 0.8729 | 0.8725 | 0.046 |
| | 6hrs | 0.8609 | 0.8606 | 0.035 |
| | 9hrs | 0.8708 | 0.8705 | 0.034 |
| Bulb(40watt) | 3hrs | 0.8617 | 0.8615 | 0.023 |
| | 6hrs | 0.8709 | 0.8705 | 0.046 |
| | 9hrs | 0.8710 | 0.8706 | 0.046 |
| Sunlight(summer) | 3hrs | 0.8637 | 0.8627 | 0.116 |
| | 6hrs | 0.8742 | 0.8737 | 0.057 |
| | 9hrs | 0.8723 | 0.8721 | 0.023 |
| Sunlight (winter) | 3hrs | 0.8735 | 0.8729 | 0.068 |
| | 6hrs | 0.8638 | 0.8629 | 0.104 |
| | 9hrs | 0.8705 | 0.869 | 0.172 |

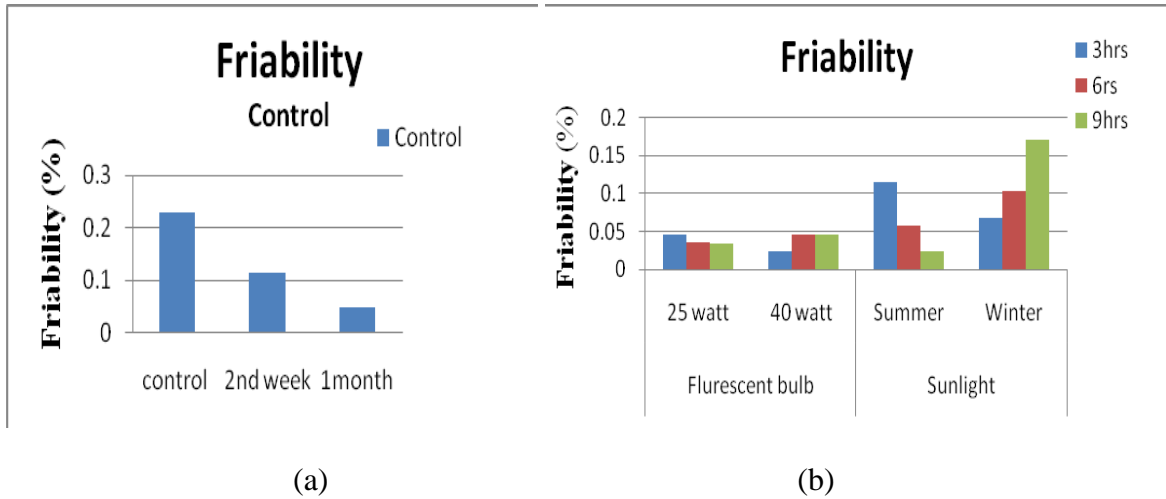

Fig 4.6: Bar diagram of Friability for (a).control and (b). under light condition.

There was no spectacular effect shown on tablet's thickness and hardness due to exposure of light in varying condition. Also there was no wide changes in result between control and other under light sample. They fall in within the range proximity to control experiment.

Fig 4.7: Bar diagram of Thickness for (a).control and (b). under light condition.

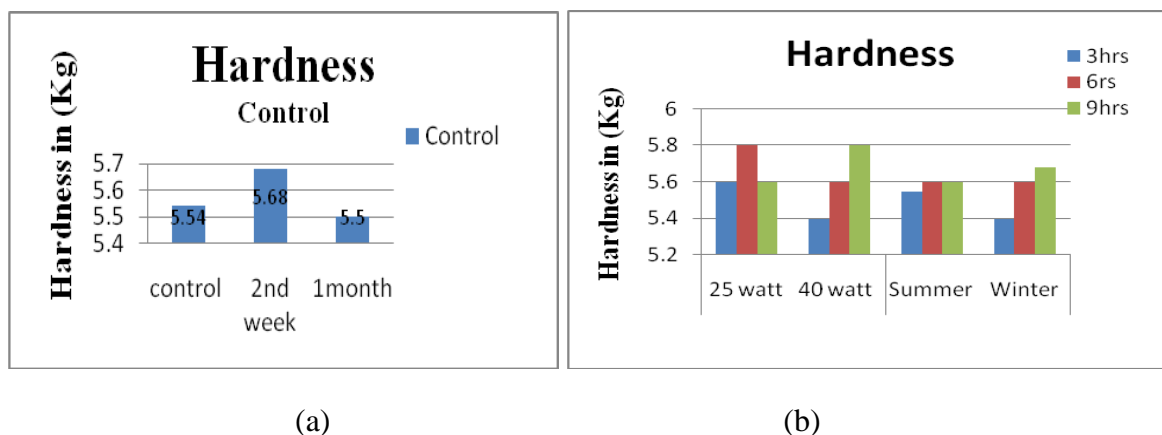

Fig 4.8: Bar diagram of Hardness for (a). control and (b). under light condition.

There was significant result shown about potency in various exaggerated environment. In normal or control sample the linearity of the curve was conspicuous. Both the Flupentixol and Melitracen gave linear curve of a wave length at 229nm and 258nm respectively. The linear regression equation obtained was $Y = 104.1x - 0.005$, for flupentixol and $Y = 4.513x + 0.003$, for melitracen. In which Y is the absorbance and X is the concentration (in $\mu\text{g/ml}$) of pure drug solution.

Fig 4.9: Graphical representation of linearity curve of (a). flupentixol and (b). Melitracen for control/ Standard sample.

The potency of control changes with time during experiment. The absorbance of first control tablet was 0.7103 and 0.593 for flupentixol and melitracen respectively. With time the potency of tablet decreases gradually. They can be illustrated as potency in milligram below

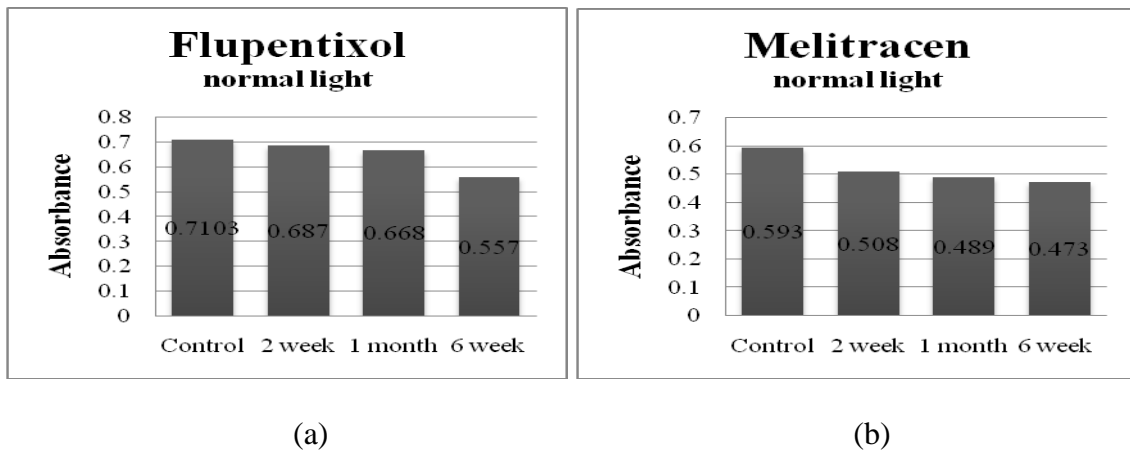

Figure 4.10: Bar diagram of the absorbance of the Control or normal light sample. (a). flupentixol and (b). Melitracen.

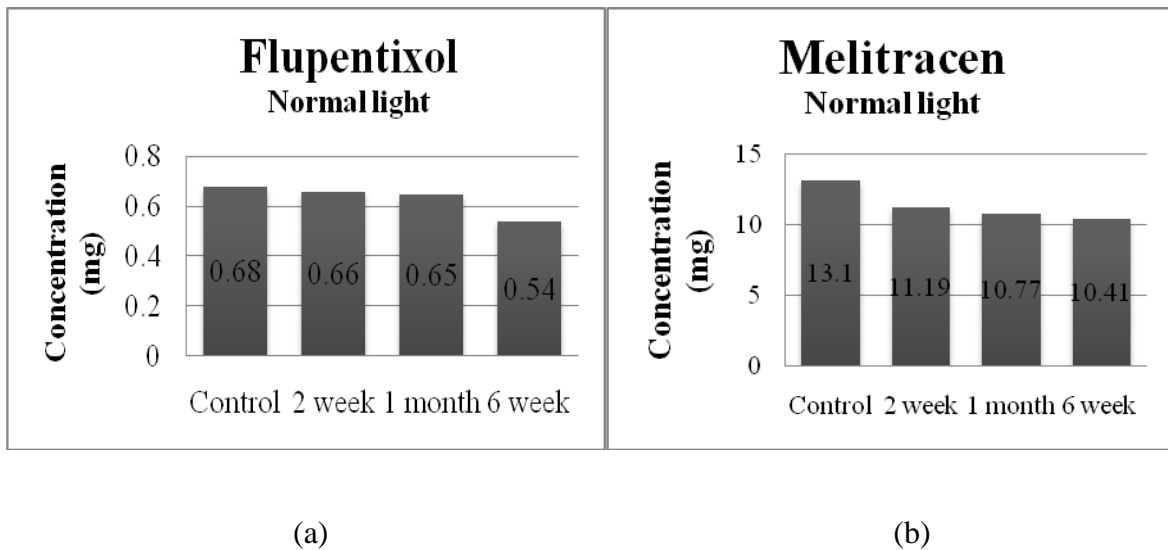

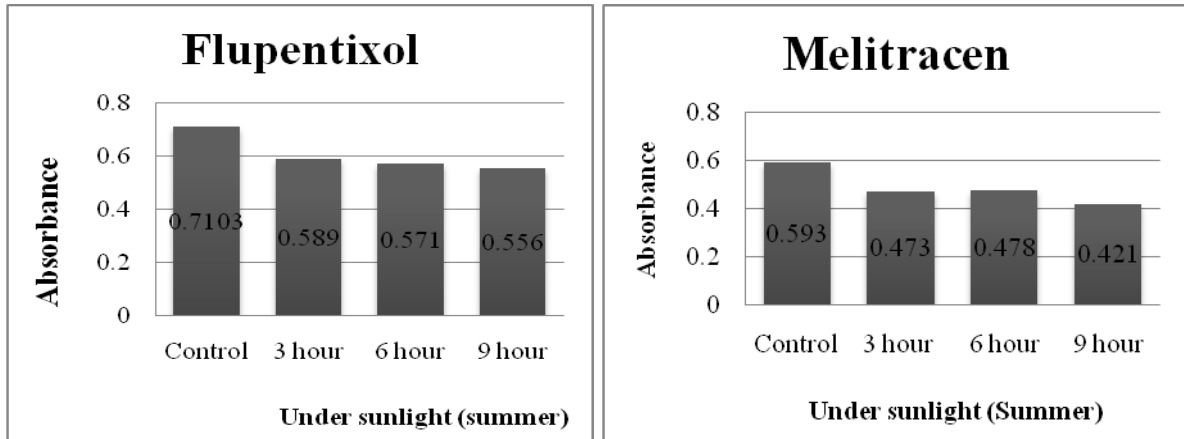

Figure 4.11: Bar diagram in concentration of normal light sample. (a). flupentixol and (b). Melitracen.

The absorbance in sunlight and under florescent bulb exposure gently down with the more expose time. It was shown that the absorbance of three to nine hours sample was downhill.

From the control it was implied that it has photosensitive effect in the exposure to light. The absorbance bar diagram for sunlight and florescent bulb is given below:

Spectral analysis:

From the diagram it is shown the absorbance changes with time. From the experiment it suggests that the combo drugs have photosensitivity. Thus, we interested to find in which group's decay was responsible for altering in absorbance. Scanning of sample tablet through

IR spectroscopy gave spectroscopic data which gave characteristics bands. Characteristics bands at $3000\text{-}3100\text{ cm}^{-1}$ and $1400\text{-}1600\text{ cm}^{-1}$ were due to aromatic ring skeleton vibration. Bands near $3200\text{-}3650\text{ cm}^{-1}$ signifies the presence of -OH group. For strong bands near $1000\text{-}1400\text{ cm}^{-1}$ indicates C-F present in any of the compound. For bands near $2850\text{-}3000\text{ cm}^{-1}$ signifies the presence of C-H bond stretching. Tertiary amine may present due to the band near $1200\text{-}1350\text{ cm}^{-1}$.

Figure 4.20: IR spectrum of control sample (Flupentixol and Melitracen).

IR spectrum for control tablets after 4 weeks had slightly different spectrum. It showed new band near 3566 cm^{-1} . This new band would be the presence of -OH group due to oxidation of the sample. New band near 808 cm^{-1} could be the presence of substituted aromatic ring (disubstituted).

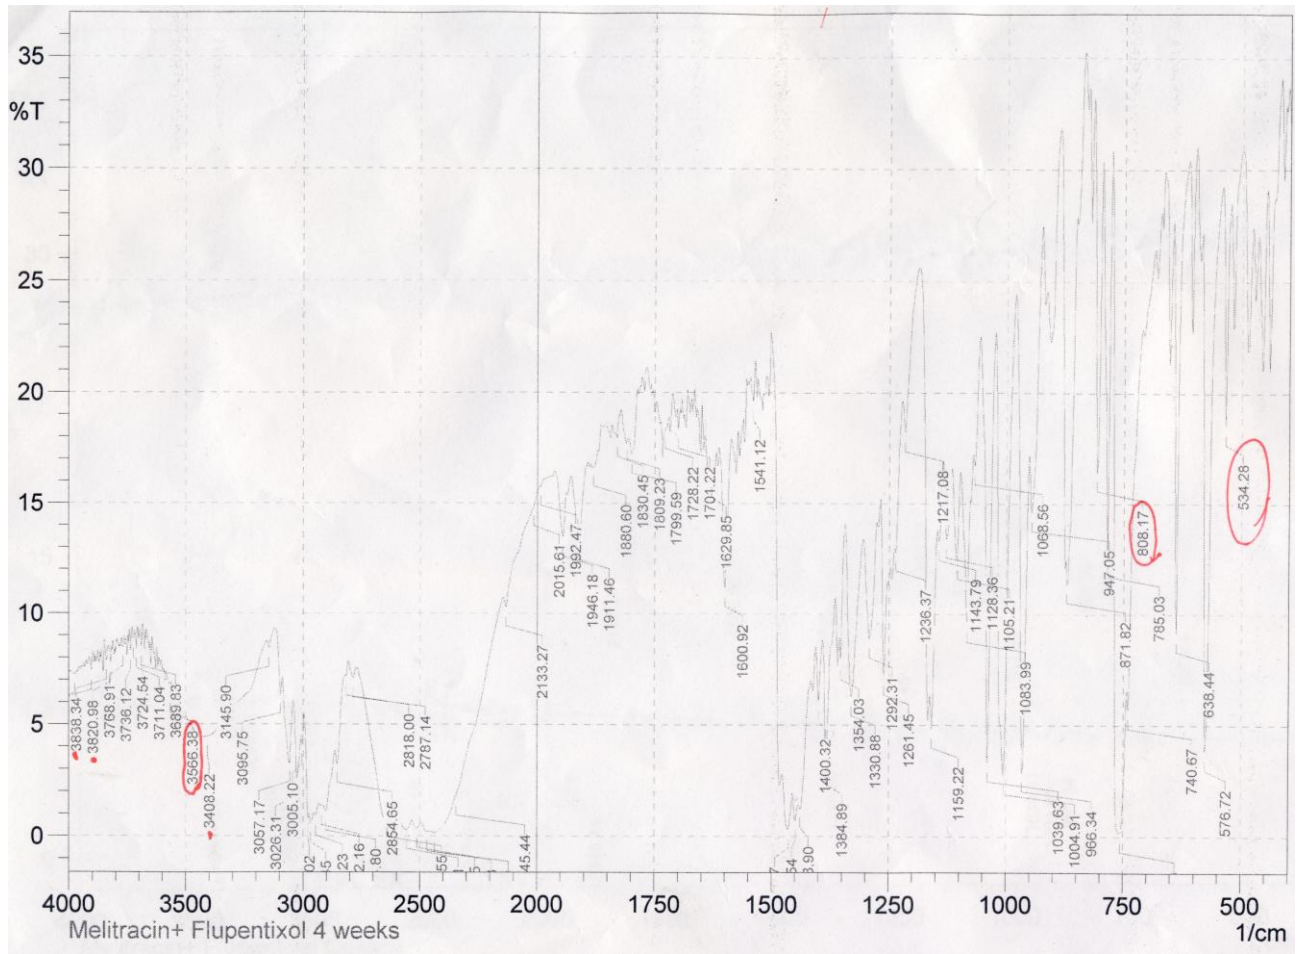

Figure 4.21: IR spectrum of control sample after 4 weeks (Flupentixol and Melitracen).

Chapter 5:

CONCLUSION

Conclusion:

In this project the photodegradation of flupentixol-melitracen are portrayed to show the effect of light on the tablet's physical parameters and potency of the drug itself. The analytical method is done accurately to avoid interference of many parameters. The result obtained is accurate. Moreover the method of analysis is simple, inexpensive to give the various results about potency.

However it shows that the product we use SENSIT is photosensitive require protection from light.
